## 3 Introduction

### 3.1 What is TBarCode?

**TBarCode** is a set of professional tools for the generation of barcodes. More than 100 different symbologies (linear barcodes, 2D barcodes and stacked barcode variants) can be printed or exported as graphics files. All industry formats are supported. The barcodes can be generated in the highest possible resolution and quality.

**TBarCode** is available in several versions for different operating systems, applications and programming environments.

The following versions are included in the Windows setup:

<b>TBarCode OCX</b>	A Microsoft® ActiveX® compliant barcode control. It can be used with Microsoft® Office applications as well as by software developers.
<b>TBarCode .NET</b>	A .NET barcode library for software developers. It includes barcode controls for Windows Forms and ASP.NET 2.0.
<b>TBarCode Library</b>	A dynamically linked library (DLL) for software developers.

Additionally the following versions are available as separate downloads:

<b>TBarCode/X</b>	<b>TBarCode</b> software for Linux® and UNIX® platforms. <b>TBarCode/X</b> includes: <ul style="list-style-type: none"> <li>▪ command-line tools,</li> <li>▪ filter scripts, and</li> <li>▪ <b>TBarCode Library</b> for UNIX®.</li> </ul>
-------------------	---

### 3.2 What is TBarCode Library?

**TBarCode Library** is a software library for barcode generation. It is the core of all **TBarCode** products. The library is available for software developers to integrate barcode generation in custom applications. TEC-IT provides the **TBarCode Library** for a wide range of platforms:

- 32-bit Microsoft® Windows® platforms
- 64-bit Microsoft® Windows® platforms
- Microsoft® Windows® CE / Windows® Mobile platforms (available on request – please contact us with your platform details)
- Most Linux® and UNIX® platforms

The **TBarCode** setup for Windows® includes **TBarCode Library** as dynamically linked library (DLL). A static library is available on request.

**TBarCode Library** for Windows is often just called “**TBarCode DLL**”.

### 3.3 Scope of this Document

This document explains how you can use the **TBarCode Library** in your own applications. The complete application programming interface (API) is described in the *TBarCode Library Developer Reference*.

### 3.4 Restrictions of the Demo Version

In the demo version the barcodes will be drawn with a demo-hint. That means that the word “Demo” or the phrase “www.tec-it.com” is drawn partially over the barcode (see Figure 2). The demo-hint does not influence the readability of the barcode in a negative way.

When barcodes are generated in PostScript® or PCL® format, an additional horizontal bar is drawn across the barcode. Like the other demo-hint this bar usually does not influence the readability of the barcode. Its sole purpose is to indicate that the barcodes were generated with a demo version of **TBarCode**.

- ▶ In special cases (e.g. very small or high-resolution barcodes) you may want to test the product without restrictions. To obtain a temporary license key contact [sales@tec-it.com](mailto:sales@tec-it.com).
- ▶ For enabling the full-featured version (without the demo hints) you can obtain a license key from TEC-IT (<http://www.tec-it.com/order/>).
- ▶ For more information on licensing **TBarCode**, please refer to chapter 9, “How to License TBarCode”.

## 4 Installation

---

### 4.1 TBarCode for Windows

#### 4.1.1 Requirements

The following operating systems are supported:

- Microsoft Windows 2000
- Microsoft Windows XP
- Microsoft Windows Server 2003
- Microsoft Windows Vista
- Microsoft Windows Server 2008
- Microsoft Windows 7

#### 4.1.2 Download and Setup

Download **TBarCode** from <http://www.tec-it.com/Download> ► *TBarCode* and execute the setup application. Depending on your selection one or more of the following components are installed – along with documentations and sample applications:

- **TBarCode OCX**  
A barcode ActiveX control for Microsoft Office users and for software developers. User manual and API reference are included in the setup.
- **TBarCode Library**  
For software developers. Developer manual and API reference are included in the setup.
- **TBarCode .NET**  
For .NET developers. Developer manual and API reference are included in the setup.

► Administrative rights are required to install **TBarCode**.

## 5 General

---

Please keep in mind that **TBarCode Library** is a software component. It is not an executable by its own. Read this document and check out the accompanying sample applications to learn how to embed **TBarCode** into your own application.

### 5.1 TBarCode Library

The dynamically linked library is named *TBarCode10.dll* and can be found in the directory *C:\Program Files\Common Files\TEC-IT\TBarCode\10.0*.

- ▶ Make sure that the **TBarCode Library** (*TBarCode10.dll*) is located in a path included in the 'PATH' environment variable (or in the same directory as your application).

#### 5.1.1 Additional Dependencies

**TBarCode Library** further uses the DLL *zlib1.dll*. This DLL file is optional: *zlib1.dll* is only required if compression of barcode data is applied.

If *zlib1.dll* is missing at runtime the **TBarCode Library** is still working, but data compression is disabled.

- ▶ Make sure that *zlib1.dll* is located in the same directory as *TBarCode10.dll*.
- ▶ *zlib1.dll* is only provided for 32-bit Windows platforms.

#### 5.1.2 C/C++ Header Files

The DLL is delivered with C/C++ header files needed for embedding the DLL (the library) into your own application. These files are located in the folder *C:\Program Files\TEC-IT\TBarCode10\Include* (or in the folder you have chosen during setup).

Include the file *tbarcode.h* in your project in order to get full access to the DLL functions within C/C++:

```
#include "tbarcode.h"
```

Header files for miscellaneous programming environments (for example Delphi) are included in the appropriate source code samples. Several samples are installed with **TBarCode**; more samples are available on the TEC-IT web page <http://www.tec-it.com>.

#### 5.1.3 Linking

TEC-IT provides the file *TBarCode10.lib*, which contains the entry points to the DLL interface. Link your application using this file. This file is located in the folder *C:\Program Files\TEC-IT\TBarCode10\Lib* (or in the folder you have chosen during setup).

## 6 Using TBarCode

---

### 6.1 Important Functions

The basic function calls to produce a barcode are as follows (in the appropriate order).

- *BCLicenseMe()*  
This function licenses **TBarCode** and removes the demo restrictions. Licensing must be performed before you draw a barcode (e.g. after **TBarCode** has been loaded to memory).
- *BCAlloc()*  
This function sets up and initializes the internal barcode structure. You receive a handle that is used for all other function calls (*pBarcode*). This function must be called before any other function expecting a **pBarcode** parameter.
- *BCSetBCType()*  
Sets the type of the barcode (symbology); e. g. *Code39*, *Code128*, *UPC*, *EAN*, *2OF5*, ...
- *BCSetText()*  
Sets the data to be encoded as barcode.
- *BCSetModWidth()* (optional)  
This function is used if an application requires a specific module width. Without this function the module width is computed automatically by **TBarCode**. It adapts to the barcode dimensions (specified via a bounding rectangle) and the current input data.
- More optional barcode settings  
Set the barcode properties according to your application; e.g. *BCSet\_PDF417\_RowHeight()*, *BCSetCDMethod()*, *BCSetBearerBarWidth()*, *BCSetRatio()*, *BCSetTextDist()*, *BCSetLogFont()*, ...
- *BCCheck()* (optional)  
This function checks if the data characters are valid for the selected barcode type. If invalid data was encountered it returns an error-code. If escape-sequences are used, they are not translated in this function. It must be called before *BCCalcCD()*.  
Note: This function call is optional; *BCCreate()* calls this function in any case automatically.
- *BCCalcCD()* (optional)  
This function computes the check-digit(s) for the given input data and the selected check-digit method. The check digits are added to the barcode data automatically. On demand you can retrieve the check digits with *BCGetCheckDigits()*. Please consider that symbology internal check digits (like *Modulo 103* of Code-128) are not calculated with this function – they are always part of the created barcode.  
Note: This function call is optional; *BCCreate()* calls this function in any case automatically.
- *BCCreate()*  
This function prepares the barcode structure (pattern) to be drawn with *BCDraw()*. It returns *ErrOk* if everything is ok. If not, it returns an error code (of type *ERRCODE*) that specifies the error in more detail. After *BCCreate()* all parameters of the resulting barcode are available (e.g. number of modules, dimensions, check-digits, meta-description).
- Get Dimensions (optional)  
After *BCCreate()* you can call the methods *BCGetBarcodeHeight()*, *BCGetBarcodeWidth()*, ...

- *BCDraw()*  
This function draws the barcode into the given device context. The barcode dimensions are set through passing the coordinates of a bounding rectangle. No special mapping is performed.  
Note: Only available in **TBarCode Library for Windows!**
- *BCPostscriptToFile(), BCPCLToFile()*  
These function save the barcode in PostScript or PCL output format.
- *BCFree()*  
This function de-initializes the barcode info-structure and frees allocated memory. It must be called as last function.

▶ If any of the *BCxxxx* functions in the above described order returns an error code not equal to zero then DO NOT call subsequent *BCxxxx* functions (except of *BCFree()*). An error code < 0 indicates an error condition - subsequent calls (except of *BCFree()*) may fail and produce unexpected results.

## 6.2 Calling Order

▶ Please note: Since TBarCode 8 the following calling order must be maintained to guarantee the correct conversion of the input data to the target character set:

1. First set all barcode properties (like barcode type, translation of escape sequences, etc.)
2. Then call *BCSetBCText()*
3. Finally call *BCCreate()*

## 6.3 ANSI and UNICODE

Since version 8 of the **TBarCode Library** each function that has parameters or returns values of type string (=character pointer) is implemented in 2 versions, one for ANSI strings and one for UNICODE strings. ANSI functions end with the suffix A whereas UNICODE functions end with W.

Preprocessor defines are provided to be compatible to ANSI and UNICODE builds. These defines do not have a suffix.

Example:

```
// ANSI function - pass an ANSI text
BCSetTextA(t_BarCode* pBarCode, LPCSTR szText, LONG nLen)

// UNICODE function - pass a UNICODE/wide character text
BCSetTextW(t_BarCode* pBarCode, LPCWSTR szText, LONG nLen)

// Compatibility Define - pass a UNICODE/wide character text
// text or an ANSI depending on whether UNICODE is set or not
BCSetText (...)
```

To use the compatibility defines for the function names (like *BCSetText()*) while creating a UNICODE build, you have to define the preprocessor variable `_UNICODE` before including `tbarcode.h`:

```
#define _UNICODE
#include "tbarcode.h"
```

If `_UNICODE` is undefined, the compatibility defines refer to the ANSI functions.

## 7 C/C++ Sample Code

Below are the steps to create a barcode image in C/C++ (only for demonstrative purposes, not all variables declared).

- ▶ Also check out the fully functional samples provided with the setup – or available as separate download.

Include the header-file:

```
#include "tbarcode.h"
```

Sample code for barcode generation (excerpt):

```
// Initialize library
// nothing to do for Windows (except when using TBarcode as static library)

// License the product
BCLicenseMe("LicenseeName", eLicKindDeveloper, 1, "LicenseKey", eLicProd2D);

// Allocate memory and retrieve barcode handle (pointer)
t_BarCode* pBC;
BCAlloc(&pBC);

// Adjust symbology
BCSetBCType(pBC, eBC_Code128);

// Set barcode data
char* demo = "12345678";
BCSetText(pBC, demo, strlen(demo));

// Set font height for the human readable text
LOGFONTA* pLF = BCGetLogFont(pBC);
pLF->lfHeight = 14;

// Find out wrong characters (check if data can be encoded) (optional)
eCode = BCCheck(pBC)
if (eCode != ErrOk)
{
    // your error handling
}

// Calculate check-digits (optional)
BCCalcCD(pBC);

// Create barcode pattern (bars, spaces)
BCCreate(pBC);

// Set barcode size
// Below we use Hi-Metric [0.01 mm] for hDC
rect.left = 0;           // 0 mm
rect.bottom = 0;         // 0 mm
rect.right = 5000;       // 50 mm
rect.top = 3000;         // 30 mm

// Draw to device context
// Hi-Metric [0.01 mm] for hDC
SetMapMode(hPrinterDC, MM HIMETRIC);
OffsetRect(&rect, Xpos, Ypos); // position
BCDraw(pBC, hPrinterDC, &rect);

// Save to Postscript file
// Unit is [0.001 mm] for Vector-EPS format
BCSaveImage(pBC, "barcode.eps", eIMPsVector, 50000, 30000, 0, 0);

// Save barcode image to buffer
// Unit is [Pixel] for JPG format
nWidthPx = 2 * BCGetCountModules(pBC);
BCSaveImageToBuffer(pBC, &lpszBuffer, eIMJpg, nWidthPx, 100, 96, 96);
```

```
// Release memory / free barcode structure
BCFree(pBC);

// Clean up
// nothing to do for Windows (except when using TBarCode as static library)
```

## 8 Custom Drawing Functions for Special Devices

### 8.1 Why Custom Drawing Functions?

**TBarCode Library** offers the possibility to implement custom drawing functions. This is useful whenever you control a device which is not supported by any standard-driver functionality. Good examples are laser marking devices, OS-400 specific printers, ...

Custom drawing functions can be registered as so called call-back functions. When drawing a barcode the **TBarCode Library** will call the custom drawing functions instead of using the internal drawing routines.

▶ **IMPORTANT:** Custom drawing functions will only work if a valid **TBarCode** license is provided! Temporary license keys are available on request – please contact [support@tec-it.com](mailto:support@tec-it.com). Section 9, “How to License TBarCode”, describes how to apply a license.

### 8.2 The General Concept

**TBarCode** computes a barcode using a so-called meta-description. This meta-description defines in a complete device independent way where bars and where spaces are to be drawn.

Such a meta-description consists of upper- and lowercase letters:

- Uppercase letters are placeholders for bars (or dots)
- Lowercase letters are placeholders for spaces
- The letter itself (A or B or C or ...) defines the width of the bar (space) to be drawn.

### 8.3 Linear Barcodes & PDF417

For barcodes, which are using multiple widths for the bars (or spaces), multiple uppercase (or lowercase) letters are passed to the call-back function:

Uppercase letters = bars:

- A ... bar (actual width = 1 \* module width X)
- B ... bar (actual width = 2 \* module width X)
- C ... bar (actual width = 3 \* module width X)
- D ... bar (actual width = 4 \* module width X)
- E ... and so on

The factors for the module width depend on the current print-ratio. In this example the print-ratio for the bars is 1:2:3:4

Lowercase letters = spaces:

- a ... space (actual width = 1 \* module width X)
- b ... space (actual width = 2 \* module width X)
- c ... space (actual width = 3 \* module width X)
- d ... space (actual width = 4 \* module width X)
- e ... and so on

The factor for the module widths depend on the current print-ratio. In this example the print-ratio for the bars is 1:2:3:4

X represents the module width. All actual widths of bars or spaces are usually multiples of the module width.

Each barcode symbology uses a pre-defined print-ratio (and this ratio can be adjusted by the user). For example Code39 uses the following print-ratio: 1:3:1:3

- A ... 1 X
- B ... 3 X
- a ... 1 X
- b ... 3 X

It is possible to query the used print-ratio for a specific barcode symbology – please check out the relevant functions *BCGetRatioString*, *BCGetRatioHint*, *BCGetCountBars*, and *BCGetCountSpaces*.

## 8.4 Data Matrix & QR-Code

Data Matrix and QR-Code consist of several rows. For each row, the corresponding row pattern will be transmitted to a user-defined call-back function (for drawing a row of the symbol).

The row-pattern is built by uppercase and lowercase letters. Uppercase letters are place-holders for black bars (or squares) – lowercase letters are placeholders for spaces (white squares):

Uppercase “A” - black dot/bar, Lowercase “a” - white dot/space

Figure 1: Custom Barcode Drawing

The example above shows Data Matrix, but QR-Code works the same.

### 8.4.1 About Drawing

The pattern itself contains no absolute sizes. The matrix dots (A and a) have the same width and height X. This is called the module width. By adjusting the module width to the size of the device dots (pixels) you can minimize the printing tolerances.

## 9 How to License TBarCode

In order to enable the full-featured version, you need a valid license key from TEC-IT. A description of the available license-types as well as all necessary information for ordering can be found at <http://www.tec-it.com/prices>.

If you don't know the license type according to your application, please ask our sales team ([sales@tec-it.com](mailto:sales@tec-it.com)).

For placing an online order check out <http://www.tec-it.com/order/>.

- ▶ For testing the call-back API or other evaluation purposes you can request a time-limited license key from [support@tec-it.com](mailto:support@tec-it.com).

### 9.1 Demo Limitations

Whenever **TBarCode** is not licensed with a valid license key, an additional text “Demo” or an additional horizontal bar is drawn across the barcode. In addition all call-back functions (for custom barcode drawing functions) are disabled.

To remove the demo limitations call *BCLicenseMe()* with valid a license key. For example:

```
ERRCODE eCode = BCLicenseMe("John Smith", eLicKindSite, 1,  
                             "01234567890ABCDEFGHIJKLMNQPQRSTU", eLicProd2D);
```

In Windows: *BCLicenseMe()* should be called as the first function of **TBarCode Library**.

In UNIX: *BCLicenseMe()* should be called directly after *BCInitLibrary()*.

Figure 2: Barcodes rendered **without** valid license

Figure 3: Barcode rendered with valid license

## 10 Redistributing TBarCode

---

This chapter explains what is important when redistributing a custom application that uses the **TBarCode Library**.

- ▶ Please note that in most cases you need a developer license for re-distribution of **TBarCode Library** (except for in-house applications which are bound to one or more sites).

### 10.1 Dependencies

An application that uses **TBarCode** requires the following files:

- **TBarCode10.dll**  
This is a native Win32 library that performs barcode generation. This file is mandatory.
- **zlib1.dll**  
This is a 3<sup>rd</sup>-party library that performs data compression. This file is optional. It is only required, when data compression in barcodes is used.

These files are located in the folder *C:\Program Files\Common Files\TEC-IT\TBarCode\10.0* (or in the folder you have chosen during setup).

TBarCode Library further requires the **Microsoft VC9 Common Runtime DLLs**. See next section how to distribute them with your application.

### 10.2 Redistribution

When redistributing a custom application the files described above need to be redistributed together with the application. The DLLs should be located in the same folder as the executable.

Other files than those listed above must not be redistributed.

You may have to redistribute the **Visual C++ 2008 SP1 runtime components** (MS CRT9.0 DLLs) with your application and ensure they are installed on the target computer.

There are two options to install them:

- You can install these components with the *Microsoft Visual C++ 2008 SP1 Redistributable Package (x86)* available at <http://www.microsoft.com/downloads/details.aspx?familyid=A5C84275-3B97-4AB7-A40D-3802B2AF5FC2&displaylang=en>  
The package installs all required runtime DLLs.
- If you use a setup tool and your installer supports merge modules (\*.msm files) you can add the required msm packages to your setup:
  - *Microsoft\_VC90\_CRT\_x86.msm*
  - *policy\_9\_0\_Microsoft\_VC90\_CRT\_x86.msm*

Please contact TEC-IT Support if you need help.
